A type of clay used to make pots that are used inside or for decoration.

When 2 pieces of clay are added together, each piece needs to be scored to help them join together properly.

When clay is fired it is called ceramic.

The clay glue that is used to join 2 pieces of clay together.

When you use your fingers to move the clay upwards on a wheel to make the pot taller and thinner.

The large oven that clay needs to be put in to turn it into ceramic. The temperature gets up to about 1200 degrees Celsius.
